Review:

Interval Scheduling

問題定義: 給定 n个注动 n个注动分别记作 a. 则 M成集台 S= {a.a...an}

已知名个Qi的開始時間為·Si,结束時間為兵

且满足: fcf;, Vic; 的關係

求追,个话动之最大可排轻,活动数為何?。最大了執行集合為何?

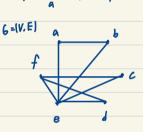

Input: Si fo fi Vai A fisf; Vis) Dutput: 最大可排程集合 Sava Fo | Sava |

Interval Graph

经定n个注动, 和各个注动之 starting time to finishing time 建構 interval graph 如下:

G=1V, E), 其中: V= {Vil Qi3

而任南點有丞相連 @ 对應之interval 有相交

Interval Graph Max Independent Set

Interval Graph & 2 max independent set = interval scheduling problem

:可利用 greedy algorithm 來解 得 最大可排程集合後,基对應之點集 V

即為 max independent set

```
给定n个注动和多个注动之starting time to finishing time
致各个公动台需要- 間場地 、术最上需几个場地
使得不會有兩路 动在同- 時間用同- t易 t色
        1 2 2 4 4 3 数為3
Example:
```

Greedy Algorithm: for each a in order of increasing start time do

指派《给尚韦指派经任何和《重鲁之最小場地》码

Low- Level Algorithm:

Interval Graph Coloring Problem

Interval_ Coloring (S)

d=0 // J用作記斡最高已指派代表地多码 A=p // A為已使用教室但owniliable 2 gueue

 $Q = \{S, s[L], S, f[L], \forall 1 \leq L \leq n\}$

while Q + Ø

X = extract_min(Q)

if a is start time if A + Ø

C = dequeue (A)

d = d+1

c = d

assign to the x else if or is finish time

c = x 2 tote

Time Completity: Olnlyn)

enqueue (c, A)
